

### Problem 1

- (A) True
- (B) False
- (C) True
- (D) False
- (E) True

### Problem 2

- (A)  $\sum_{k=1}^{\infty} (-1)^k \frac{1}{k}$
- (B)  $\sum_{k=1}^{\infty} k! z^k$
- (C)  $f(x) = \begin{cases} e^{-x^2}, & x \neq 0 \\ 0, & x = 0 \end{cases}$
- (D) Does not exist

### Problem 3

Suppose  $\{f_n(z)\}$  is a sequence of analytic functions on a domain  $D$  converging to  $f(z)$  uniformly. To prove  $f(z)$  is analytic, it suffices by Morera's Theorem to show  $\int_{\partial R} f(z) dz = 0$  for all bounded rectangles  $R \subseteq D$ .

By Cauchy's Theorem  $\int_{\partial R} f_n(z) dz = 0 \quad \forall n$ . Moreover, since the sequence converges uniformly, the limit can be interchanged with the integral. Thus

$$\int_{\partial R} f(z) dz = \int_{\partial R} \lim_n f_n(z) dz = \lim_n \int_{\partial R} f_n(z) dz = \lim_n 0 = 0.$$

□

#### Problem 4 :

Choose  $M > 0$  with  $\left| \frac{f(z)}{z^n} \right| < M \quad \forall z > 2021$

By Cauchy's Integral Formula

$$f^{(k)}(0) = \frac{1}{2\pi i} \oint_{|z|=R} \frac{f(w)}{w^{k+1}} dw$$

If  $R > 2021$  and  $k > n$ :

$$\begin{aligned} |f^{(k)}(0)| &\leq \frac{1}{2\pi} \oint_{|z|=R} \left| \frac{f(w)}{w^{k+1}} \right| \cdot \frac{1}{|w^{k+1}|} \cdot |dw| \\ &\leq \frac{1}{2\pi} \oint_{|z|=R} M \frac{1}{|w^{k+1}|} \cdot |dw| = \frac{M}{R^{k-n}} \end{aligned}$$

Taking  $R \rightarrow \infty$ , we see  $f^{(k)}(0) = 0$  for  $k > n$ .

Thus using the power series expansion at  $z=0$ :

$$f(z) = \sum_{k=0}^{\infty} \frac{f^{(k)}(0)}{k!} z^k = \sum_{k=0}^n \frac{f^{(k)}(0)}{k!} z^k$$

so in particular  $f(z)$  is a poly of deg  $\leq n$ .

#### Problem 5

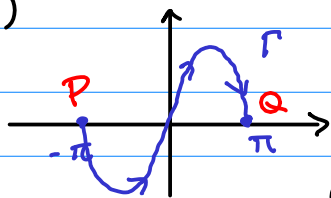

(A) By Green's Theorem

$$\oint_{\partial R} xy \, dy = \iint_R \frac{\partial(xy)}{\partial x} \, dA = \int_0^1 \int_0^1 y \, dx \, dy = \left( \frac{1}{2} \right)$$

$$(B) \quad \oint_{|z|=1} \frac{1}{z^3} \, dz = \int_0^{2\pi} \frac{1}{(e^{i\theta})^3} i e^{i\theta} \, d\theta = \int_0^{2\pi} i e^{-2i\theta} \, d\theta = \left. \frac{-1}{2} e^{-2i\theta} \right|_0^{2\pi} = 0$$

$$z = e^{i\theta} \Rightarrow dz = i e^{i\theta} d\theta$$

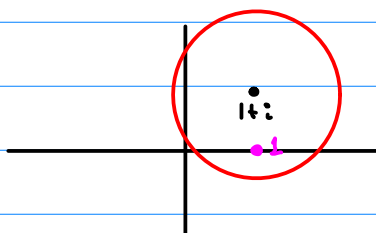

(C)

Note that  $\frac{d}{dz} \sin(z) = \cos(z)$   
 so by the Fundamental Theorem  
 of complex line integrals:

$$\int_{\Gamma} \cos(z) dz = \sin(Q) - \sin(P) = \sin(\pi) - \sin(-\pi) = 0.$$

(D)

By Cauchy's Integral formula:

$$\int_{|z-1-i|=\frac{5}{4}} \frac{\text{Log}(z)}{(z-1)^2} dz = 2\pi i \left. \frac{d}{dz} \text{Log}(z) \right|_{z=1} = 2\pi i \left. \frac{1}{z} \right|_{z=1} = 2\pi i$$

Problem 6:

$$f(z_0) = \frac{1}{2\pi i} \oint_{|w-z_0|=r} \frac{f(w)}{w-z_0} dw = \frac{1}{2\pi i} \int_0^{2\pi} \frac{f(z_0 + re^{i\theta})}{re^{i\theta}} i r e^{i\theta} d\theta$$

$$= \frac{1}{2\pi} \int_0^{2\pi} f(z_0 + re^{i\theta}) d\theta$$

$$= \frac{1}{2\pi r} \int_{|w-z_0|=r} f(w) |dz| = f_{\text{avg}}$$

$$\left. \begin{aligned} w &= z_0 + re^{i\theta} \\ dw &= ire^{i\theta} d\theta \end{aligned} \right\}$$

□
